

Trace:	May 2, 2015 3:45:05 PM	AT&T Application Resource Optimizer
Application(s) Name : Version:	FS_LTE_GameRay	
Data Collector Version:	1.0.0.1	
Device Make/Model:	HTC / HTC One	
OS/Platform Version:	5.0.2	
Network Type(s):	LTE	
Profile:	AT&T LTE	
SUMMARY		
TEST STATISTICS		
HTTPS data not analyzed 82.31% (373.64 KB)		
Duration:	6.2 minutes	
Total Data Transferred:	464,824 bytes	
Energy Consumed:	508.7 J (Energy)	
Trace Score		
Causes:	363 (out of 500)	
Effects:	234 (out of 500)	
Total:	598 (out of 1000)	
TESTS CONDUCTED		
	File Download: Test File Compression	 Connections: Inefficient Connections - Connection Closing Problems
	File Download: Duplicate Content	 Connections: Inefficient Connections - Offloading to WiFi when Possible
	File Download: Cache Control	 Connections: 400, 500 HTTP Status Response Codes
	File Download: Content Expiration	 Connections: 301, 302 HTTP Status Response Codes
	File Download: Content Pre-fetching	 Connections: 3rd Party Scripts
	File Download: Combine JS and CSS Requests	 HTML: Asynchronous Load of JavaScript in HTML
	File Download: Resize Images for Mobile	 HTML: HTTP 1.0 Usage
	File Download: Minify CSS, JS, JSON and HTML	 HTML: File Order
	File Download: Use CSS Sprites for Images	 HTML: Empty Source and Link Attributes
	Connections: Connection Opening	 HTML: FLASH
	Connections: Unnecessary Connections - Multiple Simultaneous Connections	 HTML: "display:none" in CSS
	Connections: Inefficient Connections - Periodic Transfers	 Other: Accessing Peripheral Applications
	Connections: Inefficient Connections - Screen Rotation

Trace:

PS_3782_GamesRay

Application(s) Name : Version:

Unknown App

Data Collector Version:

1.0.0.1

Device Model/Manufacturer:

HTC / HTC One

OS/Platform Version:

5.0.2

Network Type(s):

LTE

Profile:

AT&T LTE

AT&T Application Resource Optimizer

Reducing the usage of network for file downloads can reduce your application's battery consumption.

✔

Test: **Test File Compression**

About: Sending compressed files over the network will speed delivery, and unzipping files on a device is a very low overhead operation. Ensure that all your test files are compressed while being sent over the network. [Learn more...](#)

Results:

AT&T ARD detected 0 test files above 850 bytes were sent without compression. Adding compression will speed the delivery of your content to your customers. (Note: Only files larger than 850 bytes are flagged.)

✔

Test: **Duplicate Content**

About: This test measures duplicate content. Excess duplicate content means that content was downloaded multiple times, which leads to slower applications and wasted bandwidth. [Learn more...](#)

Results:

Your trace passes with an acceptable level of duplicate content. Your trace had less than 3 duplicate items downloaded.

✔

Test: **Cache Control**

About: This test measures the presence of cache headers. For all content that should be stored in the cache the best practice is to make sure that your server is adding the appropriate cache headers. [Learn more...](#)

Results:

Your data is populated with cache headers and it passes this test.

✔

Test: **Content Expiration**

About: This test compares the number of "304 not modified" requests versus files that should be cached but were downloaded multiple times. [Learn more...](#)

Results:

It appears that content expiration is being handled properly. No caching issues were detected in this trace and it passes this test.

✔

Test: **Content Pre-fetching**

About: This test measures multiple user input bursts at it is a row. Prefetching may help speed up an app in these situations. Downloading files "as needed" can slow the user experience. If a user scrolls through the main screen of your application and has to wait for images to load, the application appears slow. [Learn more...](#)

Results:

The files in this trace seem to be downloaded in reasonable bursts, and it passes this test. Remember that this may need to change as user behavior changes.

✔

Test: **Combine JS and CSS Requests**

About: Multiple requests for CSS or JS can slow loading. Whenever possible, combine into as few files as possible. [Learn more...](#)

Results:

ARD found no issues with multiple CSS requests nor with multiple JavaScript requests.

✔

Test: **Resize Images for Mobile**

About: Images that are not correctly sized for mobile can cause extreme delays in rendering. Before delivering content to a mobile, resize it to fit the available area. [Learn more...](#)

Results:

Your trace passes. There are no image files that are 110% larger than the area specified for them.

✔

Test: **Mindify CSS, JS, JSOn and HTML**

About: Many test files contain excess whitespace to allow for better human coding. Run these files through a minifier to remove the whitespace in order to reduce file size. [Learn more...](#)

Results:

Your trace passes.

✔

Test: **Use CSS Sprites for Images**

About: Small images can be combined into Sprites, and then rendered with CSS. This will reduce the number of HTTP requests and speed the loading of your app. [Learn more...](#)

Results:

Your trace passes.

CONNECTIONS

FAIL

Date:

May 2, 2015 3:45:05 PM

Trace:

PS_312_GamesRay

Application(s) Name : Version:

Unknown App

Data Collector Version:

1.0.0.1

Device Model/Manufacturer:

HTC / HTC One

OS/Platform Version:

5.0.2

Network Type(s):

LTE

Profile:

AT&T LTE

Optimizing how you use the device's radio will speed the delivery of content and reduce your application's battery consumption.

Test:

Connection Opening

About:

This test helps ensure connections are opened properly. Some connection startups consists of an input burst, followed by a series of bursts spread out over time which can dramatically slow down the application's response time and waste energy on the device. This is a self test. [Learn more...](#)

Self Evaluation:

If you see many application-initiated bursts, consider a transaction manager to group these more closely together.

Test:

Unnecessary Connections - Multiple Simultaneous Connections

About:

This test measures bursts that could be more tightly grouped. Syncing all of your data connections can help reduce the amount of time your application is on the network, reducing the battery drain. That will also make your content appear to load faster to the user. [Learn more...](#)

Results:

4 sets of [bursts](#) that could be more tightly grouped.

Test:

Inefficient Connections - Periodic Transfers

About:

This test helps ensure that your periodic connections are truly needed for the customer, which if not handled properly could cause excessive power drain. [Learn more...](#)

Results:

No periodic transfers were detected in this trace. It may be worthwhile to look for connections that happened regularly, but are not at exact intervals. This can cause excessive battery drain.

Test:

Inefficient Connections - Screen Rotation

About:

This test tracks screen rotation, to see if the app is pinging the server on orientation changes, or actually completely redundant content. If you see this in your trace - consider a new layout for existing content (rather than re-download) or sending the orientation change later as a part of a larger data transmission. [Learn more...](#)

Results:

Either no screen rotations were noted or the screen rotations did not trigger network activity.

Test:

Inefficient Connections - Connection Closing Problems

About:

This test checks that connections are closed promptly. If not effectively closed with the last data, the server timeout can turn the radio on just to close your connections, which wastes power and bandwidth. [Learn more...](#)

Results:

AT&T ARO detected that 84.5 Joules (29.8% of the total energy) was used to control these [connections](#). By closing connections promptly, you will reduce battery drain.

Test:

Inefficient Connections - Offloading to WiFi when Possible

About:

This test is a check to see if you are transmitting large chunks of data. When this occurs you may consider offloading to WiFi when appropriate. [Learn more...](#)

Results:

There were not many large bursts of data seen in this trace, and it passes this test.

Test:

400, 500 HTTP Status Response Codes

About:

HTTP status response codes in the 4xx range indicate a client request error, and 5xx codes indicate a server error. There should be zero such errors in your application. [Learn more...](#)

Results:

No 4xx or 5xx HTTP status response codes were detected during the trace.

Test:

301, 302 HTTP Status Response Codes

About:

Redirects are an easy way to switch users to different versions of your data. However, redirects also add significant latency to your application. Use with care. [Learn more...](#)

Results:

No 301 or 302 HTTP status response codes were detected during the trace.

Test:

3rd Party Scripts

About:

Connecting to 3rd party content can create slowdowns in your app. If these external files fail to load, you can have a huge effect on the customer experience and load times. Consider loading these in an asynchronous manner. [Learn more...](#)

Results:

Your trace passes.
